

Overview

Document Type: Test Summary Report

Application: Google Translate – Text Translation

Version: 1.0

Testing Type: Manual Testing

Prepared By: Sharmini Udayakumar – Junior QA Engineer

Testing Scope: Functional, Usability, Performance, Compatibility and Negative Testing

Languages Considered: English, Tamil, Sinhala and other supported languages

Test Environment: Google Translate Web Application – <https://translate.google.com/>

1. Test Summary

Manual testing was performed to validate the key Google Translate user flows and supporting features defined in the test plan.

Testing focused on the core translation flow, language selection and detection, language swapping, text input, translation result actions, History, Saved translations, long-text handling, negative scenarios, usability, basic performance and compatibility.

A risk-based and practical user-scenario approach was followed. Positive, negative, boundary and exploratory scenarios were considered to identify functional issues and unexpected user-facing behavior.

2. Test Coverage

The following major areas were covered:

- Text translation and translation result display
- Source/target language selection and language search
- Automatic language detection
- Swap languages
- Typing and pasting text
- Translation result actions – Listen, Copy, Search, Rate, Share and Save
- History and saved translations
- Search, sorting, deletion and export of saved translations
- Empty, invalid and long-text inputs
- Usability and UI behavior
- Basic performance observations
- Browser/responsive compatibility
- Negative and exploratory testing

3. Test Results

The executed test cases were reviewed against the expected behavior defined in the test plan and test case document.

Result	Count	Summary
Passed	122	Functionality behaved as expected
Failed	1	Long-text boundary issue identified
Need Improvement	2	Translation quality and user guidance issues identified

4. Key Findings

TC-094 – Long Text Boundary

Status: Failed

When text exceeded 5,000 characters, the application displayed:

"To translate text longer than 5,000 characters, copy and paste instead."

However, after copying and pasting the text, the input remained limited to 5,000 characters. The suggested workaround therefore did not provide the expected solution.

Defect: BUG-001

Severity: Medium

Priority: Medium

TC-092 – Saving Long Translation

Status: Need Improvement

When attempting to save a long translation, the application displayed "**Translation too long to save.**" However, the message did not provide sufficient information about the limitation or guidance on what the user should do next.

Defect: BUG-002

Severity: Low

Priority: Medium

TC-051 – English → Tamil Translation Quality

Status: Need Improvement

The translation was generally understandable, but some wording was direct or contextually unsuitable,

and some English terms remained untranslated.

Defect: BUG-003

Severity: Medium

Priority: Medium

5. Defect Summary

Defect ID	Test Case	Area	Severity	Priority	Status
BUG-001	TC-094	Long Text / Boundary	Medium	Medium	Open
BUG-002	TC-092	Save / Usability	Low	Medium	Open
BUG-003	TC-051	Translation Quality	Medium	Medium	Open

6. Risks and Limitations

- Translation quality was evaluated from a practical user perspective and does not represent complete linguistic validation for all supported languages.
- Performance observations can be affected by network conditions and external services.
- Compatibility results depend on the browsers, devices and screen sizes available during testing.
- External features such as Share, Google Search, voice functions, Google Sheets export, microphone may depend on external services or permissions.

7. Overall Conclusion

A total of **122 test cases passed**, demonstrating that the majority of the tested Google Translate functionality operated as expected. The major user flows defined in the test plan were covered through manual functional, negative, boundary and exploratory testing, together with usability, basic performance and compatibility observations.

In addition to the passed test cases, **three findings were identified**, including **one failed boundary scenario and two areas requiring improvement**. The main failed scenario was related to the **5,000-character text limitation and the copy-and-paste guidance**, where the suggested workaround did not allow text beyond the stated limit.

From a QA perspective, the planned testing activities have been completed within the defined scope and available test environment. The identified issues and observations have been communicated through the corresponding defect reports.
